Grip Control

Grip Control optimises traction in low-grip conditions. It adapts to the terrain by acting on the front wheels, using the electronic components already present on the vehicle. The driver remains in control and can decide at any time to move from Standard mode using the dial located on the centre console, choosing instead Snow, Off-Road, Sand or ESP Off.

Normal mode:

System calibrated with a low and fixed level of spin based on a compromise between the different levels of grip normally encountered.

ESP OFF:

Allows the possibility of disconnecting the dynamic stability control (ESP) and the traction assistance (ASR/Grip Control) up to 30 mph to give back complete control to the driver. Beyond this speed, the systems reconnect automatically for your safety.

Snow mode:

On moving off, the system adapts its strategy to the conditions of grip encountered wheel by wheel. When making progress, the system optimises spin to provide the best acceleration possible according to the grip available. Recommended in deep snow or on a steep slope.

Mud mode:

Mode which on moving off allows a lot of spin at the wheel with the least grip to allow the mud to be cleared and grip restored. At the same time, the wheel with the most grip is managed to transmit as much torque as possible.

When making progress, the system optimises spin to best meet the driver's requirements.

Sand mode:

Mode which allows some simultaneous spin of the driving wheels to allow the vehicle to move and reduce the risk of being trapped in the sand.
